

ABSTRACT OF THE DISCLOSURE

There is provided a system for changing programs stored in a terminal device, including (a) a base station, (b) a program-transferring device which
5 transfers a program to the base station, and (c) a terminal device which
downloads a program thereinto from the program-transferring device through the
base station, the terminal device including (c1) a memory storing therein at least
two programs grouped into at least two groups with respect to a function of a
program, and (c2) a management table which stores first data about whether the
10 programs are used or not, and removes a non-used program from the memory. In
accordance with the present invention, it is no longer necessary to write all
programs into a memory of a terminal device when a function of the terminal
device is to be changed. Hence, a function of the terminal device can be changed
merely by writing a necessary part of a program into the terminal device,
15 ensuring that a working time can be shortened.
